

7 DAYS TO DIE • HS LIFT

Elevator Handbook

You build the car. The mod only moves it. It will not break blocks to pass an obstruction.

Craft the **Elevator Handbook** from **1 paper** and use it in-game (not consumed). Same walkthrough: **Journal** → **Challenges** → **HS Lift**. After a new `HS_Lift.dll`, restart the game.

1. WHAT YOU CRAFT

ITEM	WHERE	WHAT IT IS
Elevator Handbook	1 paper, hand craft	This guide. Use it to read. Not used up.
Elevator Setup Tool	Workbench (electrician)	Hold it, aim at a placed block (wood through steel, not dirt), hold E .
Outside Button Panel	Workbench	One per floor, beside the shaft. Wire any one registered panel of that lift to a generator or battery bank.
Inside Button Panel	Workbench	Optional. In the car (passenger) or on the pad (vehicle). No wires. Do not register it.

Vanilla **elevator doors** for passenger lifts. **Garage / roll-up** for vehicle lifts. Half-block and plate-offset panels sit flush on thin walls.

2. SETUP TOOL (HOLD E)

Aim at the block the command needs, then pick from the wheel. If you have more than one lift, choose **Use Lift Here** first so later commands edit the shaft you are looking at.

1. **New Ped Lift / New Vehicle Lift** — always a **new** lift. Never overwrites one you already registered.
2. **Use Lift Here** — bind the aimed (or nearest) shaft.
3. **Set Corner 1 / Set Corner 2** — opposite corners. Passenger: the whole 3D cabin. Vehicle: the **floor slab only**, both corners the **same height**.
4. **Add Floor** — park the car at that landing, aim at a floor block, name it (G, 1, 2, B1, ...).
5. **Register Panel** — **outside** wall buttons only. Never the inside panel.
6. **Finished editing** — what is still missing, or Ready.

Ground floor is created when both corners are set.

3. PASSENGER LIFT

Build a **3D cabin**. Smallest interior **1 wide × 2 high**. Floor: any block. Walls and ceiling: **plates** and/or **hatches**. Mark opposite corners of that whole box. You need **at least two shaft walls**.

The mod places walls first, then floor, then ceiling, then interior, so the cabin does not collapse while it rebuilds.

Doors

- Cabin door and landing door on the same opening open and close together. A **back set** is optional and follows the others on that floor.
- Locked until the car is here. A locked **outside** door **calls** the car.
- **Cabin doors** stay shut if there is **no walkable floor** outside (drop or a wall in your face). Outside landing doors are *not* locked by that check.
- **Hold E** on the inside panel and pick a floor. A **tap** of E does not send the car.
- No inside panel: **hold E** on the cabin door while standing in the car. Closing the door does not send the car.

Players, vehicles, and loot inside the cabin ride with it.

4. VEHICLE LIFT

- **Platform only** — both corners at the same Y. No cabin box.
- One garage / roll-up per landing. Those doors **stay put**.
- Pad here: E opens that door. Pad elsewhere: E calls it; the door opens on arrival.
- Inside panel **on the pad**. Do not register it.
- The truck and anything on the pad ride.
- Do **not** build the pad out of **Plate Double** (pass-through). Use full cubes or any solid floor.

5. PLATES, SHEETS, PASS-THROUGH

YOU PLACE	WHAT THE LIFT DOES
Floor — any solid	Rides with the car.
Walls / ceiling — plates or hatches	Ride. Regular plates are not pass-through.

YOU PLACE	WHAT THE LIFT DOES
Sheets (Wood - Sheet / billboard)	Pass-through. Stay at the landing. Use around button panels.
Plate Double	Pass-through. Not for a vehicle pad.
Round ladder, wall letters / numbers	Pass-through.

Do not build cabin **walls** out of sheets — only the floor will move and the car will fall apart.

6. POWER

- Register only outside panels that belong to **this** shaft.
- Unregistered panels do nothing and cannot steal power from another lift.
- Wire **any one** registered outside panel. That powers the whole lift. Other shafts need their own circuit.

7. CALLING, FLOORS, DOORS

- **Outside button:** tap E to call (or open doors if the car is already here).
- **Inside panel:** hold E, choose a floor. Tap does nothing.
- The car will not leave while something is in the **doorway**. Sheets and plate doubles do not count as blocked.
- Doors auto-close after **20 seconds** (real time) if the opening is clear.
- Walk out while they are closing: they **open again**, then retry when you are clear.
- **Floor letter:** vanilla wall letter/number within 3 blocks of each outside door. They show the floor the car is on, including while it is passing.

8. IF IT WILL NOT MOVE

- **Finished editing** lists what is missing.
- No power, or the wrong lift's panel.
- Shaft blocked — it stops; it will not chew through your build.
- Doors cannot close — wait until the opening is clear.
- Fewer than two supporting shaft walls on a passenger car.
- Restart the game after a new DLL.

Admins: console `hslift.hslift debris` clears dirt and rubble in the footprint (not the car, doors, panels, or pass-through).
